

A New Kind Of New Energy Vehicles The Compressed Air Driven Car

Shanghai DENAIR Compressor Co., LTD <http://www.denaircompressor.net>

In the increasingly serious environmental pollution cases, the most widely used sources of daily use of tools: the car was placed in the major energy transformation of automobile manufacturers in front of what is gas-powered car pull, pull electric vehicles, hybrid pull an endless stream, but The newly developed compressed air in the car in front of God, horses are clouds. If you tell someone that you do not need to develop the car full energy, you will marvel of stunned, Europeans do not always lack of romantic innovative ideas, they developed a new compressed air powered car - compressed air powered car .

The car engine works from the traditional gasoline engine, [air compressor](#) powered cars complete knowledge of the compressed air by the contraction and expansion of the piston up and down movement as the vehicle to provide forward momentum, the air can be said is completely free to human nature, ever use of resources, a French company took advantage of these principles to develop their first fully environmentally friendly compressed air powered car-MiniCAT

Some people may ask such a car is not equipped with a big gas tank to sub it? You can clearly tell you we did not, they use similar high-intensity gas tank used diving equipment, so a can of compressed air can push a 700-kg car traveling 200 km. This completely beyond our imagination. And such a car driving very fast, can reach a top speed of 110 km due to the body using special materials to reduce weight in the 200 km or 10 hours is no need to consider increasing the gas problem, entirely suitable for city workers. Some people may have doubts, and this car with gas will be very troublesome, and can also be very clear to tell you, this car with gas is very convenient, if connected to the air compressor can be completed in 4 hours the filling process, if the company's designated filling point filling, only just three minutes to complete filling, much faster than the gas station, oh, you only need to do this cost 1.5 euros, equivalent to RMB is not to 14 dollars.

Technology is really changing the lives ah, think about the future of our air compressors have a new purpose, and excited ah.
